

Riparian Rule Talking Points, Background, and Questions - Draft May 20, 2014

This is a working draft of overall topic areas and background needed to develop EPA talking points for the June 18-19 Environmental Quality Commission (EQC) meeting in Salem, OR and for the June 23 Board of Forestry (BOF). I have nested questions from DEQ and BOF and some preliminary responses in these topic areas.

I would suggest we come up with our talking points, then check if they are responsive to the questions. Then we can strategize what we want to present and what we want to have answers to in case we are asked.

Main Points

- *Speak to importance of protecting cold water for fish. Environmental Benefits to Riparian Rule and Need for Rule.*
- *EPA's Support of Riparian Rule for small and medium fish-bearing streams*

Topics:

Attachment 1: Importance of Protecting Cold Water: Temperature Guidance (John, Dru, NOAA, others)

Attachment 2: Environmental Benefits to Riparian Rule (All)

Attachment 3: Riparian Rule and Regulatory Authorities – WQS, TMDLs, CZARA (Rochelle, Jenny, Alan, Others)

Attachment 4: Where Riparian Rules Apply (Rochelle, Jenny, Alan, Others)

Attachment 5: RipStream and Paired Watershed Study (Peter, All)

Attachment 6: Additional Rulemaking for Type N Streams (?)

Att. 1: Importance of Protecting Cold Water: Temperature Guidance

Talking Points

- High water temperatures are a major factor harming salmon. Those endangered and threatened ESA salmonids and other salmonids need cold water to survive. Numerous scientific studies of habitat and high temperature impacts on salmon, steelhead, and resident native fish have been completed over the past two decades. These indicate that high temperatures are a major factor contributing to salmon decline (*PNW Temp Guidance*, p. 10). The high quality, thermally optimal waters that do exist are likely vital for the survival of ESA-listed salmonids (*PNW Temp Guidance*, 2003, p.32).
- Background on Temp Project. Knowing that high temperatures threaten and endanger salmonid species in Oregon, EPA started the Temperature Project from 2000-2003. This was an interdisciplinary team of water quality specialists, fish biologists, hydrologists, geomorphologists, ecologists, and other scientists from multiple agencies and organizations. The goal of the project was to use the most recent scientific studies to develop guidelines for developing water quality standards. These incorporated understanding what types of temperatures and thermal regimes salmon need to survive and thrive. Six scientific papers incorporated information from hundreds of studies to provide the scientific and technical foundation for the guidance, and two independent interdisciplinary scientific peer review reviewed and commented on the guidance and the scientific issue papers.
- The Temperature Project concluded that the most important factor for salmon are cold water and a return to a natural thermal regime. The mix of numeric and narrative criteria were intended as anchor points to protect and restore the natural thermal regime.
- A major assumption of the temperature numeric WQS is that water is cold in the headwaters and will deliver colder water downstream where temperatures may be naturally higher. It also assumes this cold water will be delivered during the late spring and early fall (“shoulder seasons”) when salmonid spawning occurs. Therefore, the temperature guidance chose temperatures that were on the *higher* end of optimal, *assuming* that cold water upstream will be delivered downstream at all times of the year, especially critical shoulder season months. So PCW and cold water in upstream areas is necessary for the numeric criteria to be effective.
- Although EPA was challenged on our approval of DEQ’s temperature WQS, EPA prevailed in 2012 on the numeric water quality standards because of how the temperature standard worked as a whole to restore the natural thermal regime. Cold water delivered downstream spatially and seasonally was key to the U.S. District Court upholding the biological basis behind the numeric criteria.
- Existing cold water helps ensure that downstream temperatures are able to meet standards.
- With climate change, the warmer temperatures will likely reduce salmon habitat making protecting areas with cold water even more critical.

Other Background for Responses

What ODEQ wants EPA to Address: Construct behind PCW [answered above], **Intent of the 0.3°C human use allowance**, How anti-deg provision is intended to protect the natural thermal regime which protects the natural resources [answered above], the scientific underpinning for taking a NTP approach and how PCW fits into this construct [answered above]

BOF: What is the biological basis of the PCW standard (BOF question) [Answered above]?

Att. 2: Environmental Benefits to Riparian Rule

Talking Points

Other Background for Responses

ODEQ: Clarification on how WA rule allowing for 2.8 degrees increase really applies to forestry

EPA: Temperature impairments, salmon studies, Oregon Plan, RipStream, CZARA

Att. 3: Riparian Rule and Regulatory Authorities (WQS, TMDLs, CZARA)

Talking Points

Water Quality Standards

- The goals of the Clean Water Act are to protect and restore our nation's waters.
- Briefly, OR's temperature standard was derived from EPA's Pacific Northwest Temperature Guidance (2003). This Guidance, in turn, was based upon hundreds of studies on salmonid life stages' biological thresholds for temperature—where injury and mortality are prevented in the target organism.
- Biologically-based pollutant criteria, including the temperature criteria, are chosen to be protective of the defined uses for the streams; in this case, to support an aquatic life use - fish. It does not make sense to choose criteria that do not protect the use or result in unacceptable mortality or injury to the use such that the goal cannot be achieved.
- The temperature criteria identified in the guidance and adopted by Oregon work together to encompass the thermal complexity of streams.
- While the numeric criteria are from the upper ends of the ranges found to be protective of the aquatic life uses, the protecting cold water narrative, and other narratives, enable such criteria to be fully protective, since fish are reliant on cold water areas ('refuges') for maintaining a healthy life cycle, and together, the criteria protect the bulk stream temperatures from being too warm in the short and long term, so that fish can survive, but the colder waters enable the population as a whole to not only survive but to be self-propagating.
- [The State determines how and where it will apply its Riparian Rule for nonpoint sources, but it is consistent with the PCW WQS.]
- [Anti-deg language]
- Per Oregon's approved rule language that is in effect for CWA purposes, the PCW applies where T&E species are present; areas upstream of where T&E species are present, and where critical habitat is present.
- There is no map currently adopted into standards – it is a narrative use. The other temperature criteria apply to the designated use maps adopted into Oregon regulations. There are year-round fish uses as well as spawning use maps for criteria that apply for specific times of year. There are typically two maps per basin unless no salmonid uses occur in a particular basin. Other aquatic life, beyond salmonids, are sensitive to temperature, however, OR identified salmonids as the most sensitive to temperature, and so salmonids (salmon, steelhead, trout, and bull trout) comprise the use that is designated in the maps for OR waters. The other aspects of water quality standards that are relevant include OR's antidegradation policy in effect for Clean Water Act purposes. Before any degradation of a waterbody with water quality that is better than the criteria is allowed, federal regulations state that, "the State shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control." Further, under the federal regulations,

any degradation that is allowed must still provide water quality sufficient to protect existing uses fully.

- **we could also show Dan Isaak model or Tim Beechie output, and speak to colder waters as a hedge against climate change and the fact that colder waters could be most impacted..
-

Other Background for Responses

BOF: What are the respective authorities/obligations on the issue of forest management and protecting water quality?

Answer: Water quality standards apply to the waterbody, not the regulated source. In terms of ensuring compliance with WQS, OR has the authority to regulate NPS in their state statutes, and ODEQ, in particular, has the authority to enforce the laws on OR's books. [something need to add that OR use sound science in making decisions about achieving WQS?]. Have to protect existing uses (add?).

TMDLs

CZARA

- The Coastal Zone Management Act of 1972 (CZMA) established a program for states to voluntarily develop comprehensive programs to protect and manage coastal resources. To receive federal approval and implementation funding, States had to demonstrate that they had programs including enforceable policies that were sufficiently comprehensive and specific both to regulate land uses, water uses, and coastal development and to resolve conflicts between competing uses. In addition, the states had to have authorities to implement the enforceable policies.
- The Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) specifically charged State coastal programs, as well as State nonpoint source programs, with addressing nonpoint source pollution affecting coastal water quality. Section 6217 of CZARA ("Protecting Coastal Waters") provides that
- EPA and NOAA jointly administer the Coastal Nonpoint Pollution Control Program (CNP) provided under Section 6217 of CZARA. Each Coastal State participating in the CNP must develop and submit a CNP Control Program to NOAA/EPA for review and approval/disapproval action. The State's CNPCP must contain
- Include info on the Czara award
- In 1998 NOAA/EPA issued a conditional approval of Oregon CNP subject to the development of additional management measures, many of which Oregon has addressed. However, some of the management measures still need to be addressed. The additional management measures need to address greater protections for forestry related issues, on-site waste water disposal and storm water from new development.

- In 2009 NWEA file suit
- The Riparian Rule will be useful to address a deficiency identified in EPA and NOAA's proposed notice of intent to disapprove Oregon's Coastal Nonpoint Program. The

Other Background for Responses

BOF: Does this riparian rule process relate to the NOAA/EPA proposal to disapprove the State of Oregon's coastal nonpoint pollution control program, if so, how?

In NOAA/EPA's December 20, 2013 proposed decision document to disapprove the State of Oregon's Coastal Non-point Pollution Control Program, NOAA/EPA identified that the State needed additional management measures backed by enforceable authorities to address issues related to: a) on-site waste water disposal, b) storm water discharges from new development, and c) forestry. In addition, NOAA/EPA asked for public comments on the adequacy of existing agricultural practice.

Regarding forestry, NOAA/EPA noted in their proposed decision document that State had not demonstrated it has management measures, backed by enforceable authorities in place to : 1) protect riparian areas for medium and small fish bearing streams and non-fish bearing (type-N) streams; 2) protect high-risk landslide areas; 3) address the impacts of forest roads, particularly on so called "legacy" roads and 4) ensure adequate stream buffers for the application of herbicides, particularly on type "N" streams.

NOAA/EPA are currently reviewing the 85 comment letters and over 800 documents submitted during the public comment period on our proposed disapproval decision. While timing of BOF's riparian rule making process and the final CZARA decision don't align, the ultimate BOF rule changes are critical since the need for additional management measures for better buffer protections was identified in NOAA/EPA's 1998 initial review of the State's CNPCP and all subsequent reviews thereafter .

Programmatically, the intersection of the BOF's Riparian Rule process and NOAA/EPA's decision on Oregon's Coastal Non-point Pollution Control Program occurs in the following two different scenarios:

1) If, after review of the agencies' records and public comments received, NOAA/EPA find that the State has established the necessary management measures for an approvable CNPCP, the agencies's would issue a public notice on a proposed decision to approve the State's CNPCP and provide an opportunity for the public to comment on this decision. The BOF's Riparian Rule making process would become part of the record for this decision action.

2) If NOAA/EPA make a final decision to not approve the State's CNPCP, the new Riparian Rule would be considered in any subsequent review of the agencies' disapproval decision. A disapproval decision would be made if the State fails to demonstrate that it has established adequate management measures to address all of the concerns related to a-c above, and possibly ag, as well.

Is the concept of drafting the rule keyed on where the PCW standard has been established a legally defensible approach to meeting our Clean Water Act obligations? ***[Will be answered above]***

Att. 4: Where Riparian Rules Apply

Oregon's Designated Uses and implementation of protecting cold water designated uses vs. the riparian rule mapping:

Talking Points

- We support the approach that the State is proposing on where the riparian rules should apply. [RL]
- We commend OR for using published and peer reviewed scientific data in guiding the application of its nonpoint source rules and BMPS. [RL]
- We feel OR's application of the riparian rules is to the highest priority areas; however, we encourage OR to consider applying the rules more broadly to ensure restoration and protection of aquatic life. [RL]
- [Some language on how it might be consistent with the concepts of protecting cold water in temp guidance.]
- [Some language on how it supports an important part of the Coastal Nonpoint Program.]
